

TSRC Corporation Environmental Policy

Cherish the earth and its resources while fulfilling our responsibility in protecting the environment; commit to energy saving and carbon footprint reduction for sustainable operation.

● Principles

- In response to the global climate change and carbon reduction, we establish the management systems in support of the mission of protecting the environment, set up targets for greenhouse gas emission and the reduction of product carbon footprint, and obtain third-party certifications towards carbon neutrality.
- In compliance with government regulations, we strive to optimize the utilization efficiency for resources such as energy, water and others. Respective targets are set to reduce air pollution, wastewater, and toxic substances, as well as the adoption of renewable energy. We continue to improve and mitigate climate change risks and sustain the ecological nature through effective management systems.
- In creating sustainable corporate values, we continue to engage stakeholders and collaborate with business partners to reduce the environmental impacts of the product throughout its lifecycle, at different stages of research and development, raw materials' selection, transportation and logistics, production, packaging, and product services.

● Approaches

- We continue to train and promote programs to help our employees to understand and comply with the regulations and requirements related to industrial safety, environmental protection, and employee health.
- We adhere to domestic and international sustainability standards, develop green manufacturing processes, innovate to enhance material circularity, and reduce energy and resources consumptions.
- We focus on product quality and safety, aim to achieve environmental improvement, and incorporate environmental impacts in feasibility studies.
